TOPIC TAGS: geologic survey, geologic prospecting, map

ABSTRACT: Regional geophysical surveys are conducted in Kazakhstan to divide the territory into tectonic regions, to study its plutonic structure, and to solve some problems of geophysical mapping. The results of these surveys will make it possible to establish structural belts and regions in which minerals are likely to be found. The basic material will be obtained from investigations of the magnetic and gravitational fields in combination with seismic studies. In the magnetic and gravitational fields, tectonic and plutonic seams are isolated which correspond to terraces in the

AUTHOR: Bachkovski, I.

TITLE: Resolving power in X-ray spectroscopy

SOURCE: B'lgarska akademiya na naukite. Fizicheski institut. Investiya na Fizicheskiya institut s ANEB, v. 10, no. 2, 1962, 5-12

TOPIC TAGS: resolving power, resolution, X-ray spectroscopy, diffraction grating, spectrometer, theodolite, beryllium, calcite, quartz, germanium, silicon

ABSTRACT: Ways of increasing the resolving power of X-ray spectroscopy have been studied with the aim of using X-ray spectroscopy in the solution of theoretical questions involving solids and investigation of energy states in electrons. Highest resolution in the field of medium X-ray wave lengths is achieved by a two-crystal spectrometer with perfect crystals possessing a narrow angle range of reflection. From the curves for beryllium, calcite and quartz, shown in Fig. 1 of Enclosure 1, it is clear that as wave length increases, width of reflection range decreases, and thus resolving power increases. At the author's suggestion,

Card 1/8 *2*

3

artificially grown crystals of germanium and silicon (Czech. J. Phys., 7 (1957), 124) have also been used at the Institute of Technical Physics of the Czechoslovak Academy of Sciences in Prague for spectral measurements. Results obtained are shown in Table I of Enclosure 2. The resolving power obtained for germanium and silicon with a reflection given in (333)-plane is very high and makes it possible to carry out various measurements with a rather high degree precision. For accurate measurements the author has constructed a two-crystal spectrometer--with Wildt theodolites--on which special stages for the crystals are mounted (Fig. 2 of Enclosure 3), thus allowing the planes of the gratings of the two crystals to be fixed at will in parallel, correct to several angular seconds. The curve of reflection from the (111)-plane of a germanium crystal, shown in Fig. 3 of Enclosure 4, most accurately coincides with the theoretically calculated curve. This coincidence is the most accurate confirmation to date of the theory of Darwin-Ewald-Prins-Kohler, and can be only attributed to the extraordinary perfection of the germanium crystals prepared by Ed. Trousil at the aforesaid

Institute. Krizek at the Institute of Technical Physics of the Czechoslovak Academy of Sciences has constructed a machine to make diffraction gratings, which is automatically operated by means of an interferometer. In the very first tests, 3600 uniformly distributed lines per millimeter were obtained. This is the greatest number of uniformly distributed lines per millimeter so far achieved. By making use of a discharge tube filled only with an isotope of mercury, it will be possible to make gratings with widths as small as 50 nm. The theoretical resolution which such gratings will be able to achieve in experimental conditions is shown in Table 3 of Enclosure 5, and will be vastly greater than hitherto possible. Orig. art. has: 3 figures and 3 tables.

SOV/91 -59-9-15/33

AUTHOR: Bachkovskiy, M.V. and Yurikov, P.A., Engineers

TITLE: Damages to Dischargers of Type RVVM-3

PERIODICAL: Energetik, 1959, Nr 9, pp 23-24 (USSR)

ABSTRACT: RVVM-3 valvetype dischargers, connected to the neutral of 6 kv synchronous compensators, are frequently damaged during thunderstorms. In November 1958, a similar case occurred in the author's power distribution system with a RVVM-3 discharger. One of the phases of a mixed open air and cable power line had a ground short circuit of 3-4 minutes duration. The protectors disconnected the 7500 kva synchronous compensator, whose neutral contained a RVVM-3 discharger. The discharger and the RVR operation counter were damaged, as shown in Figure 1 and 2. The RVVM-3 discharger had been tested in 1957 with a megohmmeter at a voltage of 2.5 kv and was found to be serviceable. When the discharger was opened after the damage had occurred, a considerable pressure was found in its

Card 1/3

SOV/91-59-9-15/33

Damages to Dischargers of Type RVVM-3

interior which was caused by continuous arcing and which indicated its defective conditions. The authors state that RVVM-3 dischargers cannot be used for protecting neutrals of generators and synchronous 6 kv compensators, operating on open air and cable lines. For satisfying the requirements of § 123 of the instructions concerning overvoltage protection, the RVVM discharger, connected to the neutral, must be converted to phase voltage. However, the plant "Proletariy" does not produce such dischargers. A note from the editor says that VNIIE or "Teploelektroproyekt" should be given the order to calculate the voltage levels which may arise during network failures and transient conditions in the neutral of 3-10 kv machines. The technical requirements for such dischargers must then be determined on the basis of these calculations. The plant "Proletariy" in turn must produce such dischargers which correspond to modern requirements. There are 2 photographs and 1 Soviet

(0.095%). The effect of each substance added was investigated separately, and also that of their use in various combinations. Curves were plotted showing the dependence of the yield of A on the presence of I and other additions. Presence of 0.6% arsenate lowers the yield of A by 1/3, small amounts, of the order of 0.009%, have no effect. Optimal counteracting of the effect of I results from the addition of 0.0036% III and 0.095% IV. The effect of I is also counteracted by the presence of only III (0.0036%), but not entirely (with a content of I up to 0.03% the yield of A is decreased by 7%). In the absence of III addition of II and

IV has no effect. With a content of I up to 0.003% an addition of IV decreases the yield of A. The presence of arsenic compounds in H₂SO₄ and II used in fermentation does not decrease the yield of A if the fermentation liquid contains sufficient amounts of III and IV:

chem

Concentration of hydrogen ions has a decisive effect on the purification of crude fermentation glycerin by active carbon at variable pH and temperature, and a pressure of about 80 mm. Hg. The minimum quantity of impurities is obtained at pH 5.2, a somewhat higher quantity at pH 7.0, and considerably higher at pH 5.2. Increased doses of active carbon (within the limits of 1 — 2 per cent) used for refining crude glycerin have a favourable effect on the degree of purification. 120°C. proved to be optimum among the temperatures investigated.

AUTHOR: Petruian, Gh. (Major General, Doctor); Oancea, Tr. (Doctor in medical sciences, Doctor emeritus, Colonel, Doctor); Bachman, M.S. (Lieutenant Colonel, Doctor); Bogdan, Tr. (Lieutenant Colonel, Doctor); Marinescu, I. (Lieutenant Colonel, Doctor); Popescu, P. (Candidate of medical sciences, Lieutenant Colonel, Doctor)

TITLE: Biliary lithiasis, observations based on 150 cases

SOURCE: Revista sanltara militara, no. 6, 1964, 993-1001

TOPIC TAGS: surgery, digestive system disease, internal medicine, digestive system

ABSTRACT: The authors have reached the following conclusions: the only treatment for chronic lithic cholecystitis is cholecystectomy. In regular cases the surgery and postoperative period proceed smoothly; when septic, mechanical and other complications are present the surgery and postoperative period are more difficult. 3. Acute cholecystitis cases, promptly operated had a much better and rapid recovery than those delayed. 4. Antibiotics are not an actual treatment but only an aid in preparing for operation and in postoperative care. 13 references, mainly Rumanian.

"Experimental Research on the Effectiveness of Some Therapeutic Measures in Blast Injury Shock"

Bucharest, Revista Sanitara Militara, Vol 16, Special No., 1965; pp 58-62

Abstract: Study on 44 dogs and 70 rabbits and 26 guinea pigs, exposed to shock from explosion of 2 kilograms of "Trotil" [TNT?] at varying distances from 2.2 to 25 meters away; use of "Dip-Dol" [Diparcol (diethazine) with Dolantin (pethidine)?] with a tracheostomy. The neuropletic treatment had good effects as had the tracheostomy in acute respiratory insufficiency. Artificial respiration was pointless. 1 chart, 2 kymograms, 3 tables.

"Indications and Value of Bilio-Digestive Anastomoses."

Bucharest, Revista Sanitara Militara, Vol 62, No 4, Jul-Aug 66, pp 675-682.

Abstract: A report on 13 bilio-digestive anastomoses, performed as emergency operations in the course of treating 200 cases of extrahepatic biliary conditions. The importance of careful technique and proper selection of the operative site is stressed. Good results were obtained especially with the Floercken method, which was used on 7 cases.

Includes one table, 7 figures and 24 references, of which 9 Rumanian, 14 French and one English-language. -- Manuscript submitted 7 February 1966.

Title : The Soils of the Molend Fir Reservation

Orig. Pub : Roczn. gleboznawcze, 1956, 5, 131-157

Abstract : The territory of the Molend Reservation near Lodz contains soils formed on sands, dusty loams, and argillaceous moraine accretions. The latter are rather highly carbonate. The densest and most flourishing growths of Abietoquercetum are found on the argillaceous soils. The morphological and some physico-chemical properties of the soils are examined.

 Fauna of Yugoslavia. Federal Experiment
 Station of Fruit Growing, Viniculture and *
 ORIG. PUB. : Zb. radova. Srpska AN, 1953, 31, 175-184

ABSTRACT : On the basis of the author's observations (1952), and literature data, a list is presented of the Yugoslavian scale insects of subfamily Diaspidinae. For 37 species of scale insects, there are described the plants upon which they feed, the places of their occurrence and, in part, the damage caused. A new species, *Quadraspidictus pelagijae* sp. n., is described. The following parasites of scale insects were noted: *Aphitis conioiae* and *Aspidiotiphagus citrinus* (from *Q. pelagijae*), *Prospaltella berleseii* (from mulberry scale insect), *Aphytis mytilansis* (from *Epidiaspis leperii*).

PERIODICAL: Referativnyy zhurnal, Astronomiya i Geodeziya, no. 10, 1962, 33, abstract 10G173 ("Tr. Odessk. gidrometeorol. in-ta", 1961, no. 24, 74 - 90)

TEXT: To study displacements of the ground surface in the region of Odessa, a comprehensive method was employed which included the geodetic, oceanographic, geomorphological and cartographic methods. The geodetic method was the principal one, i.e. the method of releveling, repeated triangulation and polygonometry. The Odessa network of releveling included 107 signs, 94 of which were wall marks. All these signs were distributed rather uniformly over the town territory. Their releveling was carried out 8 times during the period from 1882 to 1951, and after 1920 specially for studying height displacements. Two marks installed at distances 50 and 90 km from the port, i.e., in the location not subjected to landslides, were adopted as initial releveling points assumed to be

Title : Measurement of High Temperatures with Optical Filters

Orig Pub : Mat.-fyz. casop., 1956, 6, No 1, 30-55

Abstract : The first part of the article considers the existing optical methods for measuring high temperatures. The second part contains a discussion of the visual method of measuring temperature by the red-blue ratio. The nature of the method lies in a photometric comparison of the radiation density Q_1 of the investigated object and Q_2 of the comparison source. The measurements are carried out in two narrow spectral regions, which are separated with Zeiss light filters K3 and K6. The comparison source used is an incandescent bulb with a color temperature of 2360° . An analytical study is made of the ratio $Q = Q_1/Q_2$, which is a single-valued function of the temperature. Tables are given for the dependence of Q on (T) , compiled with allowances for the character of the eye's adaptation. The third part gives examples of the application of the method to the measurement of the color temperature of the Heffner candle ($T = 1830 \pm 8^\circ$), the sun ($T = 5250 \pm 50^\circ$) and of the daytime sky.

Histochemical examination of the colloids of the hypothalamus-hypophysis system. Dénes Bachrach, Kálmán Kovács, Ferenc Oláh, and Vince Varró. *Acta Morphol. Acad. Sci. Hung.* 3, 160-79(1953).—The colloid substances of the hypothalamus-pituitary system were examd. by various histochem. methods. In the system 3 colloid substances can be differentiated, one in the adenohypophysis, one in the middle lobe, and a third, a Gömböri-pod substance in the hypothalamus-neurohypophysis. Histochemically the colloid of the adenohypophysis consists of ribonucleoprotein and carbohydrates; that of the middle lobe is a mucin-like compd. contg. acid mucosaccharides; the colloid of the midbrain-neurohypophysis is probably a glycolipoprotein. B. S.

199. BACHRACH D., KOVACS K., OLAH F. and VARRO V. Depts. of path. Anat., Histol. and Med., med. Univ., Szeged *Histochemical examination of the colloids of the hypothalamus-hypophysis system* *Acta morphol. Acad. Scient. hung. (Budapest)* 1953, 3/2 (169-182) Illus. 12

The authors examined the colloidal substances of the hypothalamo-neurohypophyseal system and the adenohypophysis of human beings, dogs and rats with a variety of histochemical and histological methods (Gomori's chrome alum haematoxylin, periodic acid-Schiff with or without previous treatment with saliva or extraction in boiling chloroform-methanol, toluidine blue, methyl green-pyronine, Feulgen etc.). They come to the conclusion that neurohypophyseal colloid is hypothalamic in its origin and chemically probably a glyco-lipo-protein. The colloid of the anterior lobe shows the same staining properties as the cytoplasm of the basophils and is believed to be derived from these cells. It contains ribonucleoproteins and a carbohydrate moiety. The colloid of the intermediate lobe is similar or gives the reactions of an acid mucopolysaccharide.

- Adrenal insufficiency was produced in 100 white rats by applying a tourniquet to one or both hind legs for 4 hr. by means of an aluminium wire. The diuresis of the traumatized animals stopped after 3.5 hr. compression, followed by haemoconcentration. Forty-eight hr. after removal of the tourniquet diuresis returned to normal. Histological examination of the neurosecretory ganglion cells of the anterior hypothalamus showed marked hyperactivity of those cells during this period and extending to 70 hours following compression.

Funktionssteigerung der antidiuretischen Zentren bei experimenteller traumatischer Oligurie. Hyperfunction of antidiuretic centre as a result of traumatic oliguria ACTA NEUROVEG. (Wien) 1957, 15/1-2 (60-72) Graphs 3 Illus. 10

Rats were submitted to tourniquet shock. This produced oliguria or anuria. In all cases there seemed to be morphological changes in the neurohypophysis as well as in the supraoptic and paraventricular nuclei, suggesting an enhancement of their function.

853. PROBLEMS CONCERNING HYPOTHALAMIC NEUROSECRETION. I. THE ORIGIN OF THE NEUROSECRETION. II. MODIFICATIONS OF THE RNA CONTENT OF NERVE CELLS COMPARED TO THOSE OF THE NEUROSECRETORY SUBSTANCE IN THE RAT - Über einige Probleme der hypothalamischen Neurosekretion. I. Beiträge zur Herkunft des Neurosekrets. II. Änderungen der basophilen Substanz (Ribonucleinsäuregehalt) der Ganglienzelle zur Zeit der Abnahme bzw. Bildung des Neurosekrets der Ratte - Bachrach D. and Kőszegi B. Pathol. Inst., Med. Univ., Szeged - Z. ZELLFORSCH 1957, 46/4 (457-473 and 474-483) Graphs 2 Illus. 26
- I. The neurohypophysis of rats contains less neurosecretory material in the summer than in the winter. The aspect of the hypothalamic nuclei is the same in summer and winter. The precocious reappearance of stainable material in the paraventricular cells first, and in the supraoptic cells later following rehydration as well as its enhanced accumulation in these cells during the following days, while the re-filling of the neurohypophysis proceeds slowly and regularly, plead in favour of the hypothalamic origin of the neurosecretory substance. The aspect of the pituicytes is modified during dehydration and following rehydration but they never contain any stainable material.
- II. The quantitative variations in the cytoplasmic RNA of the hypothalamic nerve cells during dehydration and rehydration are similar to those of the neurosecretory substance. This fact seems to point to the important role of RNA in the synthesis of neurosecretory substance. Legait - Nancy (1, 2, 3)
